3 Scientific/Technical Accomplishments

Ocean biogeochemistry and marine ecosystems in the Earth system. I lead the development of Marine Biogeochemical Library (MARBL), which is the ocean biogeochemistry component used in the Community Earth System Model (CESM). In addition to promoting robust scientific representations of the ocean carbon cycle and the biological pump, we designed MARBL to be flexible with respect to coupling with multiple ocean models and invoking ecosystem representations spanning a range in complexity. I have engaged outside collaborators to contribute to MARBL and continue to build community involvement in MARBL development. We have also recently begun implementation of the Fisheries Size and Functional Type model (FEISTY) in CESM, aiming to establish a basis for prediction of climate-driven variation in fish.

Aircraft observations to constrain the carbon cycle. I collaborate with Britton Stephens (NCAR) to develop the use of aircraft observations as a constraint on the global carbon cycle. I co-lead the O₂/N₂ Ratio and CO₂ Airborne Southern Ocean Study (ORCAS), which performed intensive airborne surveys over the Southern Ocean aboard the NSF/NCAR Gulfstream V aircraft during Jan–Feb 2016. Following on the success of ORCAS, we obtained funding to support the Southern Ocean Carbon Gas Observatory (SCARGO), which will collect atmospheric CO₂ on the LC-130 aircraft servicing McMurdo Station and South Pole Observatory. In addition to several other publications, I am lead author of a significant paper using data from ORCAS and other aircraft campaigns to constrain Southern Ocean CO₂ fluxes.

Earth System Data Science. Effective synthesis and analysis of large datasets is a rate-limiting step to advancing Earth system science. I have been inspired by recent developments in open-source scientific software, notably those identified by the Pangeo community, that provide technical solutions to Big Data geoscience problems and paradigms for large-scale collaboration. I have been leading an effort to establish a “community of practice” at NCAR/UCAR aiming to improve collaboration on analytics, explore the margins of what’s possible with data, and more effectively grow our capacity in machine learning and artificial intelligence.
